

long, sides feebly convex, posterior angles sharp, border bisinuate; sutural striæ strong. First abdominal segment strongly margined for its entire length, without dilations, but with a second rounded margin which extends along the sides of the pit, this bearing along the sides a long, thin fascicle; pit very broad and shallow, extending four-fifths the length of the segment; its posterior three-fourths, very flat and sloping. First ventral segment longer than the following three together. Ventral surface of head and thorax with very coarse punctures, legs stout, femora enlarged and moderately compressed.

Host: *Pheidole knowlesi* var. *extensus* Mann.

Described from one female taken on Mt. Victoria, Viti Levu, Fiji.
