Abstract

Bionomic notes on *Pseudomorpha laevissima* (Coleoptera, Carabidae, Pseudomorphini) are here recorded for the first time. Adults, larvae and pupae of this beetle were found in 7 out of 32 nests of the ant *Camponotus rufipes* (Fabricius, 1775) examined in the neighbourhood of Barueri, SP., Brasil. The inquiline larvae inhabit the core of the nest, feed on the host larvae and migrate to peripheric areas of the nest at pupation time. Nothing was found about the feeding habits of the adult beetles which are attracted to light traps.
