

Figure 1. *Aenictus appressipilosus* (paratype). **A** Head in full-face view **B** body in dorsal view **C** body in profile.

relatively long, extending beyond $2/3$ of head length but not reaching posterolateral corner of head. Frontal carina relatively long, slightly extending beyond the level of posterior margin of torulus. Parafrontal ridge indistinct, slightly extending beyond the level of posterior margin of torulus. Anterior clypeal margin almost straight or feebly concave. Masticatory margin of mandible with large acute apical tooth followed by a medium-sized subapical tooth, and 5-6 denticles; basal margin almost straight. Maximum width of gap between anterior clypeal margin and mandibles about 1.8 times as broad as maximum width of mandible. Promesonotum convex dorsally and sloping gradually to metanotal groove; metanotal groove indistinct; mesopleuron relatively long, not clearly demarcated from metapleuron; metapleural gland bulla relatively small, its maximum diameter about 1.8 times as long as distance between propodeal spiracle and metapleural gland bulla. Propodeum in profile with straight dorsal outline; propodeal junction acutely angulate, overhanging the declivitous face; declivity of propodeum seen from back tapering above, shallowly concave, and encircled with a thin rim. Petiole in profile trapezoidal, slightly longer than high, with straight dorsal outline; anterior slope of petiole seen in profile feebly concave; subpetiolar process low with anterior corner angulated and posteroventrally produced into a spine with acute
