

Alistruma: both share body shape, postanal lip, mandibular blade and conical galea, in addition to most of the tribal characters. The next would be *Clarkistruma* with which it shares body shape and mandibular blade.

In our key to the genera (1960 p. 109) *Acanthognathus* would come under group D but would not fit the key below that. It would be in a rubric by itself, because the profile is aphaenogastriform, the mandibles are podomyrmiform and hooked hairs are present.
