

*Strumigenys thomae* sp. n., worker, holotype. Fig. 1. Head in full-face view. — Fig. 2. Thorax, waist and gaster in profile. — Fig. 3. Mandible drawn to a larger scale (Kempf del.).

Antennal scapes virtually straight, slender, with a slight subbasal incrassation at about the basal fifth of the length, the apical four fifth scarcely tapering apicad. Funiculus with the apical segment (V) about as long as I-IV combined; IV about as long as I-III; I about as long as II-III, the latter two segments scarcely longer than broad.

Thorax as shown in Fig. 2. Promesonotum gently convex in profile. Anterior border of pronotum narrowly lamellate, obliquely converging anteriorly, meeting at the middle by a broadly rounded
