

Figure 4. Evolution along the circadian period of the frequency of foraging (A) and brood-caring (B) activities for two colonies of *Nothomyrmecia macrops*.

Table 2. Colony-brood recognition experiment: number of tending behavioural acts delivered to nestmate larvae and non-nestmate larvae during the four observation sessions by workers from colonies 1 and 2

Workers from	Tending acts	toward:	
		nestmate larvae	non-nestmate larvae
Colony 1	licking:	10	25
	others:	11	12
	total:	21	37
Colony 2	licking:	11	16
	others:	17	11
	total:	28	27
