

Habitat.—Western Australia: Perth and Ludlow (J. Clark).

There are several grades between the largest and smallest workers, but they differ only in the size of the head. This species is readily distinguished from the other three species in the genus by its blood-red colour.

A large nest of this species was found under a log near Ludlow. The soldiers are very timid, and retreat into the nest on the least alarm. The workers may be seen frequently on tree-trunks during the day.

CAMPONOTUS (TANAEMYRMEX) LONGINODIS Forel.

Camponotus (Dinomyrmex) subnitidus Mayr var. *longinodis*

Forel, Arkiv. for Zool., ix. (16), p. 96, 1915. ♂

(Text-fig. 1, Nos. 3, 4.)

Worker major.—Length, 16.5-18 mm.

Head and thorax brown. Mandibles and front of face black. Funiculus, legs and gaster castaneous.

Subopaque. Mandibles coarsely punctate. Clypeus and front of the face punctate-reticulate, the rest of the head, thorax, node and gaster microscopically reticulate.

Hair reddish, long and erect, rather sparse throughout. Tibia with two rows of short, sharp, bristles. Pubescence not apparent.

Head as broad as long, broader behind than in front, the occipital border straight, or very feebly concave, the sides convex. Frontal carinae diverging slightly outward behind, broadest at the middle. Clypeus broad, feebly convex, subcarinate, the anterior border produced, convex, there is a deep fovea at each side near the middle. Eyes large, placed at the posterior third of the sides. Scapes extending beyond the occipital border by almost twice their thickness; second and third segments of the funiculus of equal length, longer than the first, the others subequal. Mandibles
