

elongate, slender, flat above; pronotum from above broadest at humeri, with sides feebly convex, mesoepinotum seen from above, quadrate, two and a half times as long as broad, with nearly straight sides; epinotal declivity very short and rounding into the basal portion. Petiolar node from above a little longer and two-thirds as broad as the postpetiole, very slightly narrowed from front to rear and with straight sides; in profile slightly convex above, the ventral outline convex at anterior half and concave behind, projected anteriorly as a blunt cone. Postpetiole in profile rather strongly convex beneath, feebly above; from above a little longer than broad, feebly broadened from front to rear, with straight anterior and posterior borders and nearly straight sides. First gastric segment a little longer than the second or third. Legs long, the femora swollen and the tibiae enlarged apically. — Shining; head with abundant, separated, coarse, punctures; thorax and abdomen with much finer and sparser punctures. Head, body and appendages with abundant, rather coarse, short and erect, brownish hairs. Color brownish red. — Type-Locality: Tumpasa, Bolivia. Cotypes: Cat. No. 25905, U.S.N.M. Described from a small series of workers, taken with callows, but without sexual or immature phases, from beneath a deeply embedded stone near a stream".
