

- 4(2) *a* Smaller species, HW 0.70–0.96 mm, HL 0.87–1.07 mm; eyes smaller, subequal in diameter to width of apical antennomere, and with about 19 to 23 distinct facets; body hairs spectacularly long and abundant (Figs. 16–18). (The only *Dacotinops* species known from peninsular Malaysia; widespread also in Borneo) *D. cirrosus* n.sp.
- b* Larger species, HW 0.98–1.10 mm, HL 1.11–1.22 mm; eyes larger, with about 30 to 40 distinct facets, and maximum diameter clearly exceeding width of apical antennomere; body hairs generally somewhat shorter

Figures 16–18. *Dacotinops cirrosus*, holotype worker, standard views. HW 0.85 mm; Pronotum width 0.68 mm; WL 1.24 mm.
