

record of this very rare pantropical ant genus in Brazil. *P. petiolatus* was previously known only from a few specimens found in Panama, Colombia and Venezuela. The two other Neotropical congeneric species, *Probolomyrmex brujitae* and *P. boliviensis* have been found in Argentina (*brujitae*), Bolivia, Colombia, Peru and Panama (AGOSTI, 1994; BOLTON, 1995). Our record extends the known range of *P. petiolatus* by 1.300 km east, covering the northern part of the Amazon basin. Our finding indicates that *P. petiolatus*, although locally rare, has a wide distribution in South America. One of the specimens has been deposited in INPA's entomological collection at Manaus, Amazonas, Brazil, and the second one has been deposited in the Laboratorio de Mirmecologia ant reference collection, CEPEC/CEPLAC, Ilheus, Bahia, Brazil.

Ampliación de ámbito de *Arctodiaptomus dorsalis* (Copepoda: Calanoida) en los Estados de Morelos y Tabasco, México

Copépodo conocido anteriormente para los estados de Aguascalientes, Veracruz, Quintana Roo Yucatán y Jalisco. En este estudio se amplía su ámbito de distribución al Municipio de Jilotepec, Morelos (julio de 1992) y a los Pantanos de Centla, Tabasco (junio de 1999). Se seleccionaron 50 hembras y 50 machos de cada una de las localidades y quedaron depositados en los catálogos More-92 y Centla-99. Departamento de Hidrobiología, UAM-I.
